

Data Collection Worksheet

Please Note: The Data Collection Worksheet (DCW) is a tool to aid integration of a PhenX protocol into a study. The PhenX DCW is not designed to be a data collection instrument. Investigators will need to decide the best way to collect data for the PhenX protocol in their study. Variables captured in the DCW, along with variable names and unique PhenX variable identifiers, are included in the PhenX Data Dictionary (DD) files.

Measured Weight at Birth: This protocol is for an examination study.

- Use calibrated infant scale for weighing infant.
- Naked weight of infant is preferred, but if the mother objects, wrap naked infant in study blanket for procedure. Record on form whether infant is weighed with a study blanket. Note: If the infant urinates in the blanket, repeat the measurement using a dry blanket.
- Place the infant on the scale so that weight is distributed equally about the center of the pan.
- Record the weight on form.
- Remove the infant from the scale, then replace and weigh a second time.
- Record the second weight on form.
- If the difference in the two weights is greater than 100 grams, obtain a third measurement.
- Note the weight of the blanket and subtract the weight of the blanket from the total weight of the infant plus blanket to estimate birth weight of the infant.
