

Data Collection Worksheet

Please Note: The Data Collection Worksheet (DCW) is a tool to aid integration of a PhenX protocol into a study. The PhenX DCW is not designed to be a data collection instrument. Investigators will need to decide the best way to collect data for the PhenX protocol in their study. Variables captured in the DCW, along with variable names and unique PhenX variable identifiers, are included in the PhenX Data Dictionary (DD) files.

Summary of the short form of the Brief Pain Inventory

The short form of the Brief Pain Inventory (BPI)[®] is a widely used questionnaire in clinical trials in which participants experience pain due to acute or chronic diseases/conditions. These diseases and conditions include but are not limited to low back pain, osteoarthritis, gastrointestinal diseases, cardiovascular conditions, musculoskeletal diseases, and cancer. The Brief Pain Inventory[®] is a self-administered questionnaire regarding the presence, severity, and localization of pain and the degree of impact on daily functions because of pain. The time period for the majority of questions on the Brief Pain Inventory[®] is the last 24 hours. The Brief Pain Inventory[®] pain assessment is done by the respondent selecting a number on a pain rating scale of 0 (no pain) to 10 (pain as bad as you can imagine), whereas the assessment of impact on functional ability is done by the respondent selecting a number on a rating scale of 0 (does not interfere) to 10 (completely interferes). Although there is no scoring algorithm in the form, the Brief Pain Inventory Users Guide[®] contains scoring information, which details how to score the respondents pain intensity (severity) and the impact of pain (interference) on functioning.
