

Data Collection Worksheet

Please Note: The Data Collection Worksheet (DCW) is a tool to aid integration of a PhenX protocol into a study. The PhenX DCW is not designed to be a data collection instrument. Investigators will need to decide the best way to collect data for the PhenX protocol in their study. Variables captured in the DCW, along with variable names and unique PhenX variable identifiers, are included in the PhenX Data Dictionary (DD) files.

Summary of the Sheehan Disability Scale (SDS)

The Sheehan Disability Scale (SDS) includes three self-rated items designed to measure how work, social life, and family life are impaired by current psychiatric symptoms (e.g., panic, anxiety, phobia, or depression). Each item includes an 11-point analog scale that uses visual-spatial, numeric, and verbal descriptive anchors simultaneously to represent the degree of disruption. Two optional items quantify days lost and days underproductive at work or school. The numerical ratings of 0-10 can be translated into a percentage or summed into a single dimensional measure of global functional impairment that ranges from 0 (unimpaired) to 30 (highly impaired). Although there are no formal norms or recommended cutoff scores, a score >5 on any of the three scales may indicate significant functional impairment.
